

# SEISMIC SENSE

TinyML Earthquake Guard: Real-time P-Wave Detection on Raspberry Pi Pico

Early Earthquake Warning System

RP2350 | SM-24 | Edge Impulse

# THE "LAST-MILE" GAP

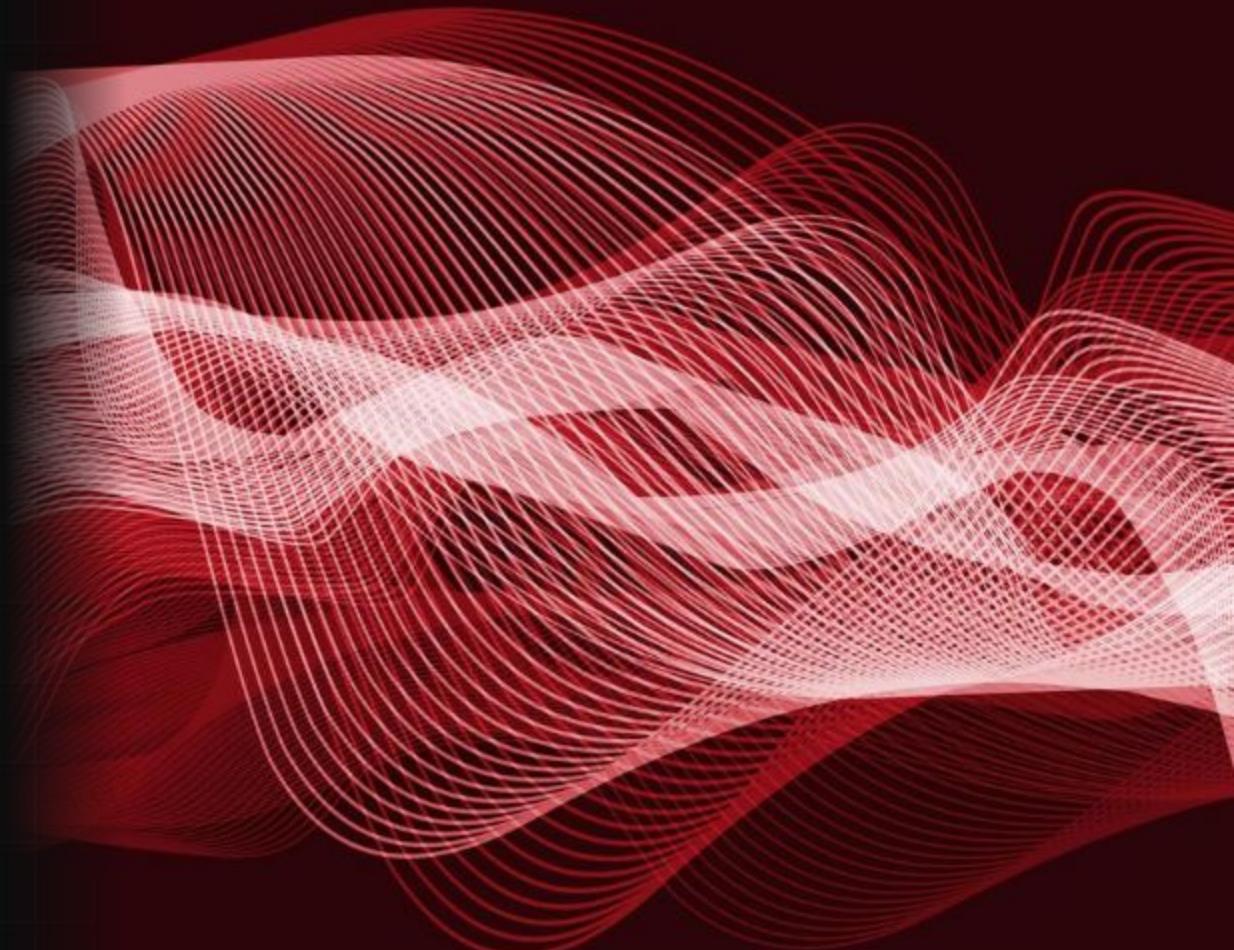

---

## COST & CONNECTIVITY

Traditional seismographs cost **\$1000+** and rely on fragile internet infrastructure. In a disaster, the cloud is often the first thing to fail.

## THE BLIND ZONE

Centralized warnings often arrive too late for those near the epicenter. We need detection at the edge.

# THE SOLUTION: SEISMIC SENSE

## STANDALONE AI

Fully offline inference on the Raspberry Pi Pico 2 using a custom TinyML model.

## LOW COST

Total Bill of Materials (BOM) under **\$50**, democratizing safety.

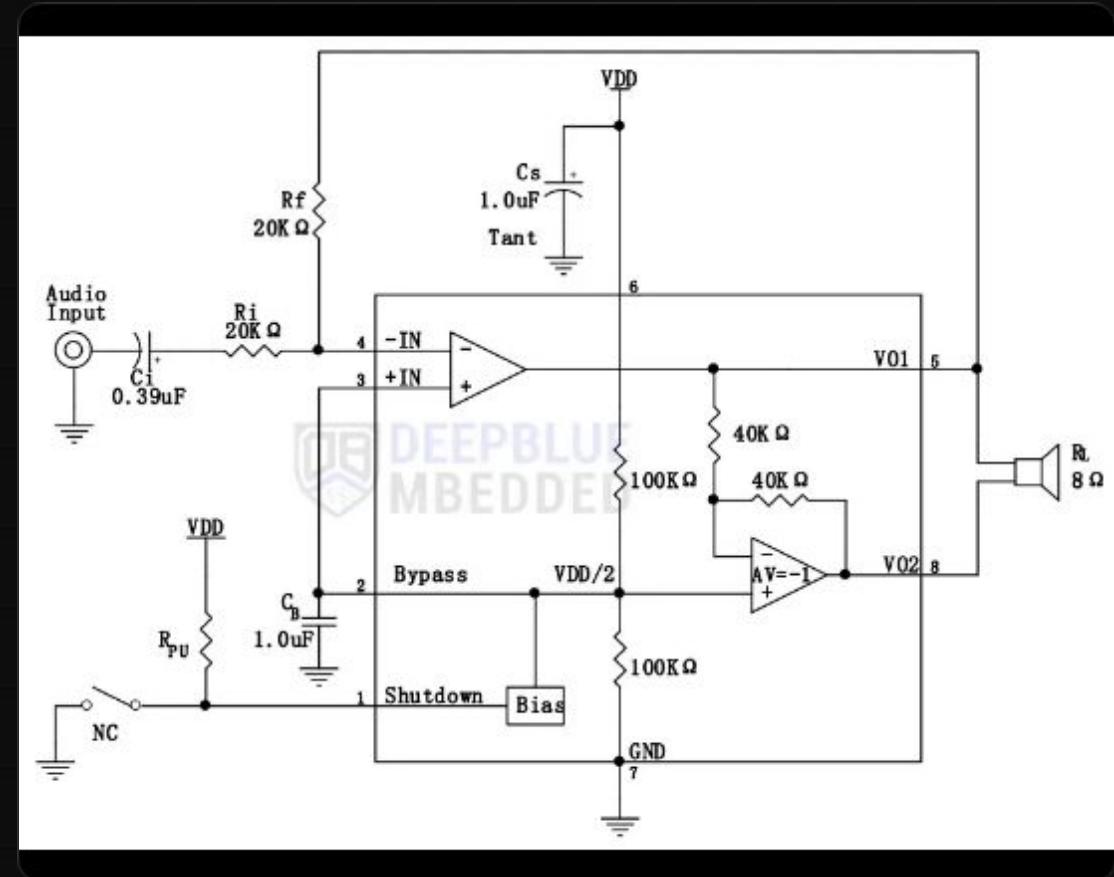

## ULTRA-LOW LATENCY

Detects P-waves in milliseconds, providing crucial seconds of warning.

# HARDWARE IMPLEMENTATION

- ✓ **Sensor:** SM-24 Geophone (10Hz resonance) for professional-grade sensitivity.
- ✓ **Amplifier:** TI INA333 Instrumentation Amp for differential noise rejection and 1.65V DC biasing.
- ✓ **Compute:** Raspberry Pi Pico 2 (Cortex-M33) handling ADC sampling and DSP.

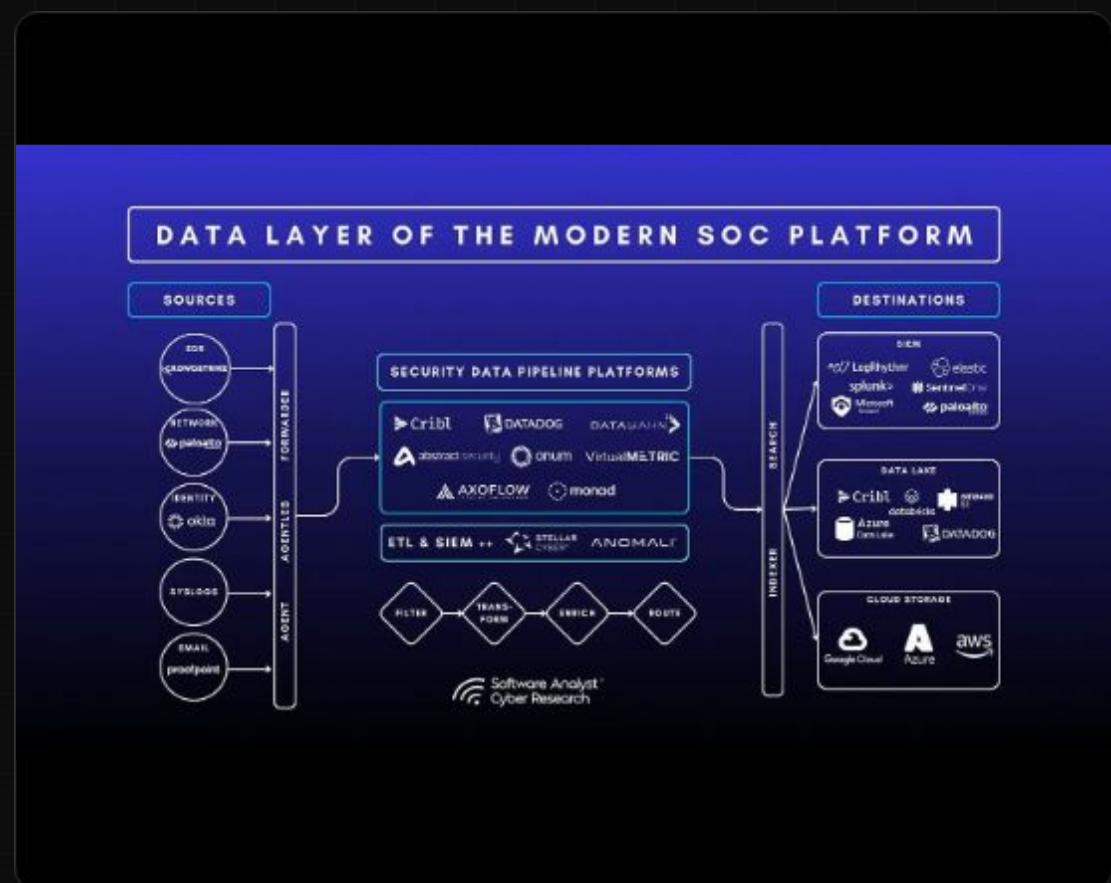

# DATA STRATEGY: FROM BIG DATA TO TINYML

## THE STEAD DATASET

We leveraged the Stanford EArthquake Dataset, converting terabytes of HDF5 waveforms into a lightweight training set.

### ETL PIPELINE:

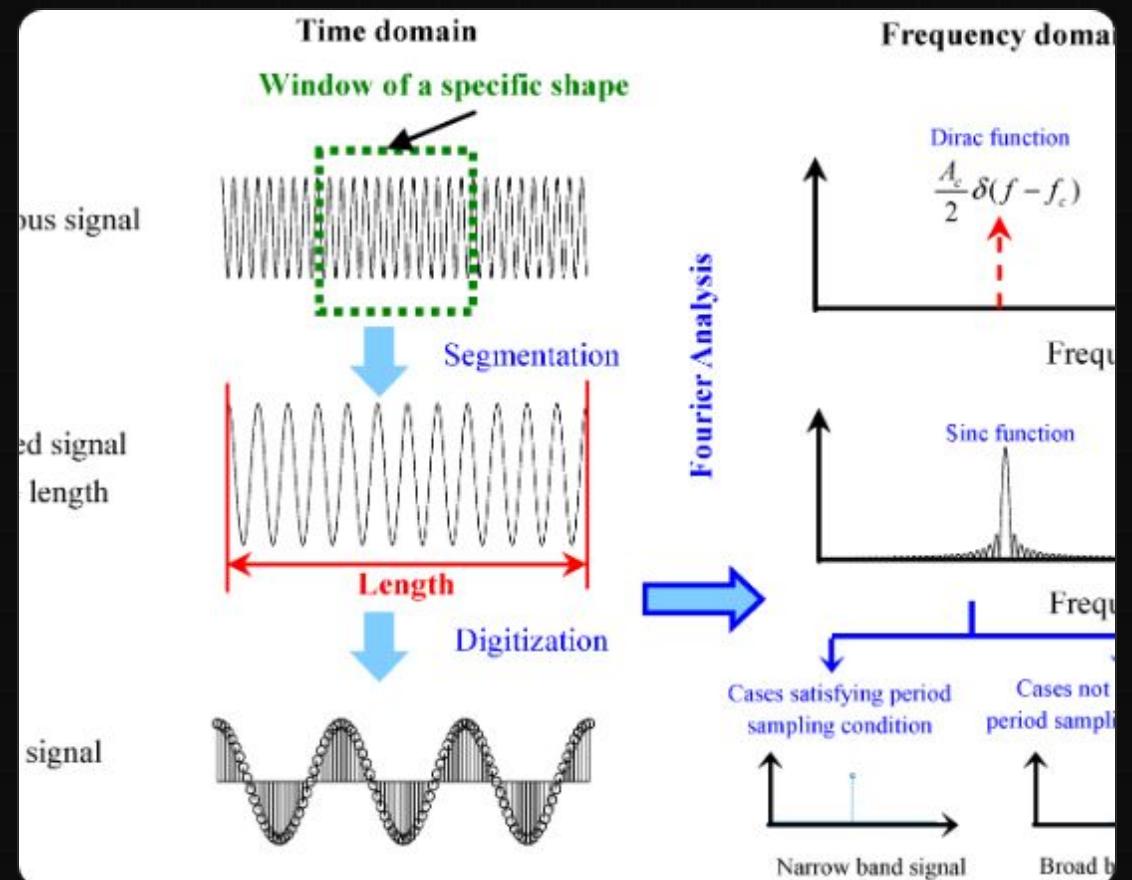

1. Filter: dist < 20km
2. Format: .npz Serialization
3. Upload: Edge Impulse SDK

# SPECTRAL PREPROCESSING

## WHY FREQUENCY DOMAIN?

Raw waveforms are messy. Earthquakes hide in specific low-frequency bands (< 20Hz) that correspond to deep P-waves. We use **FFT (Fast Fourier Transform)** to create a spectral "fingerprint" of the vibration, making the model robust to amplitude changes and background noise.

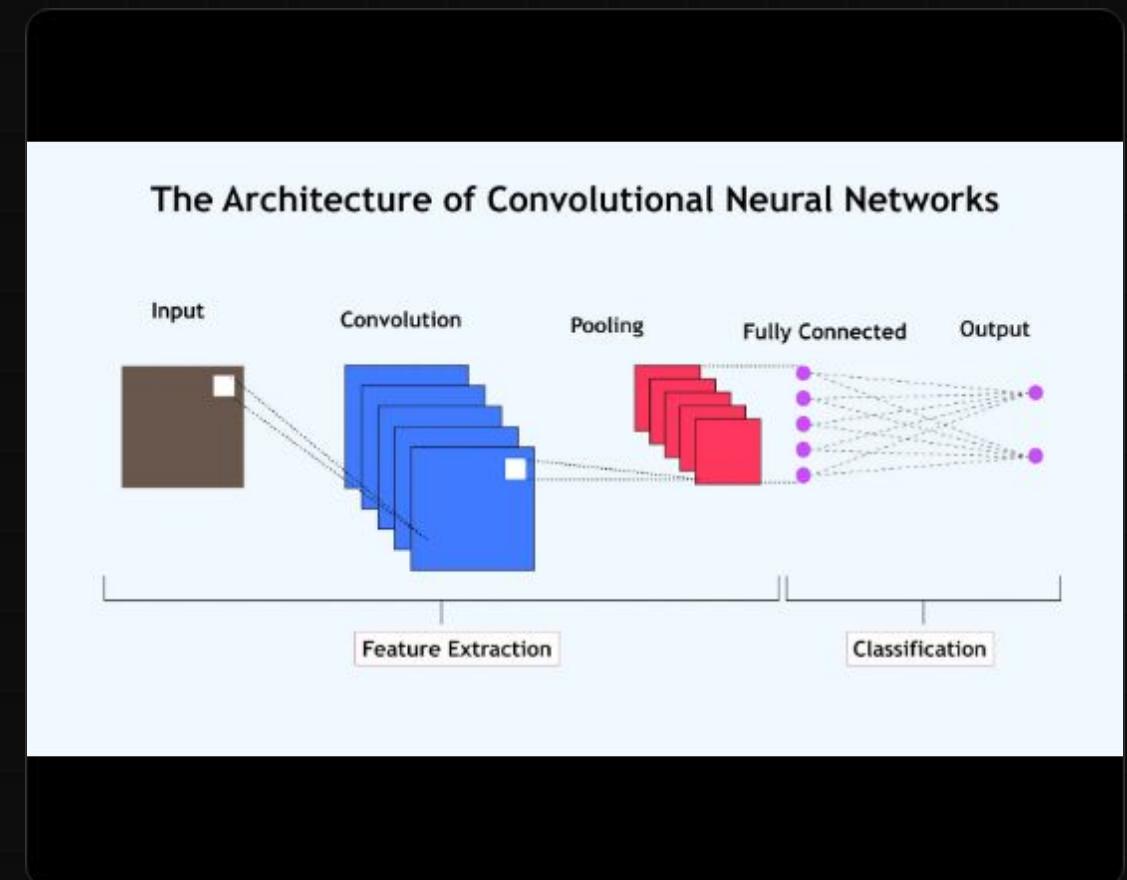

# 1D CNN ARCHITECTURE

## MOBILENET-STYLE BLOCK

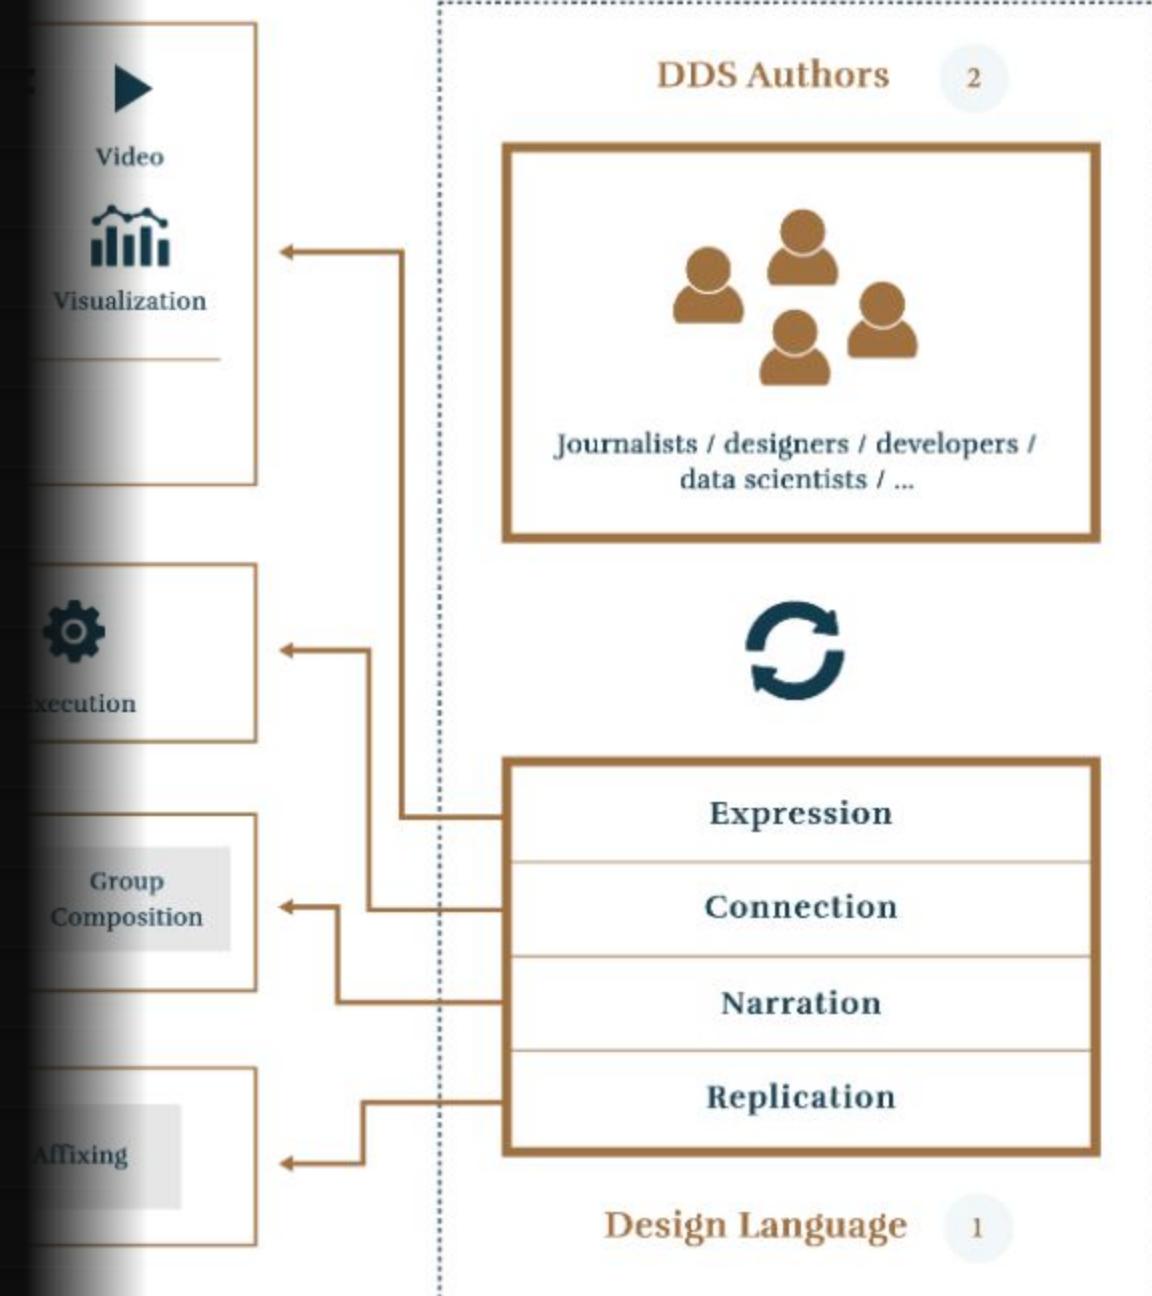

Designed for the Cortex-M33, utilizing **Depthwise Separable Convolutions** to minimize MAC operations.

- ✓ Input: 56 Frequency Features
- ✓ Conv1D: Feature Extraction
- ✓ Global Average Pooling: Reduces RAM
- ✓ Output: Earthquake vs Noise

# SYSTEM WORKFLOW

1. **Sensing:** SM-24 generates voltage.
2. **Conditioning:** INA333 amplifies signal.
3. **DSP:** Pico runs FFT (2ms).
4. **Inference:** CNN Classifies (7ms).
5. **Action:** Trigger GPIO Alert.

# PERFORMANCE METRICS

---

**96%**

VALIDATION ACCURACY

**9ms**

TOTAL LATENCY

**<5KB**

RAM USAGE

The model successfully distinguishes P-waves from footsteps and traffic noise with minimal computational overhead.

# FUTURE ROADMAP

## IOT MESH

LoRaWAN integration for city-wide alerts.

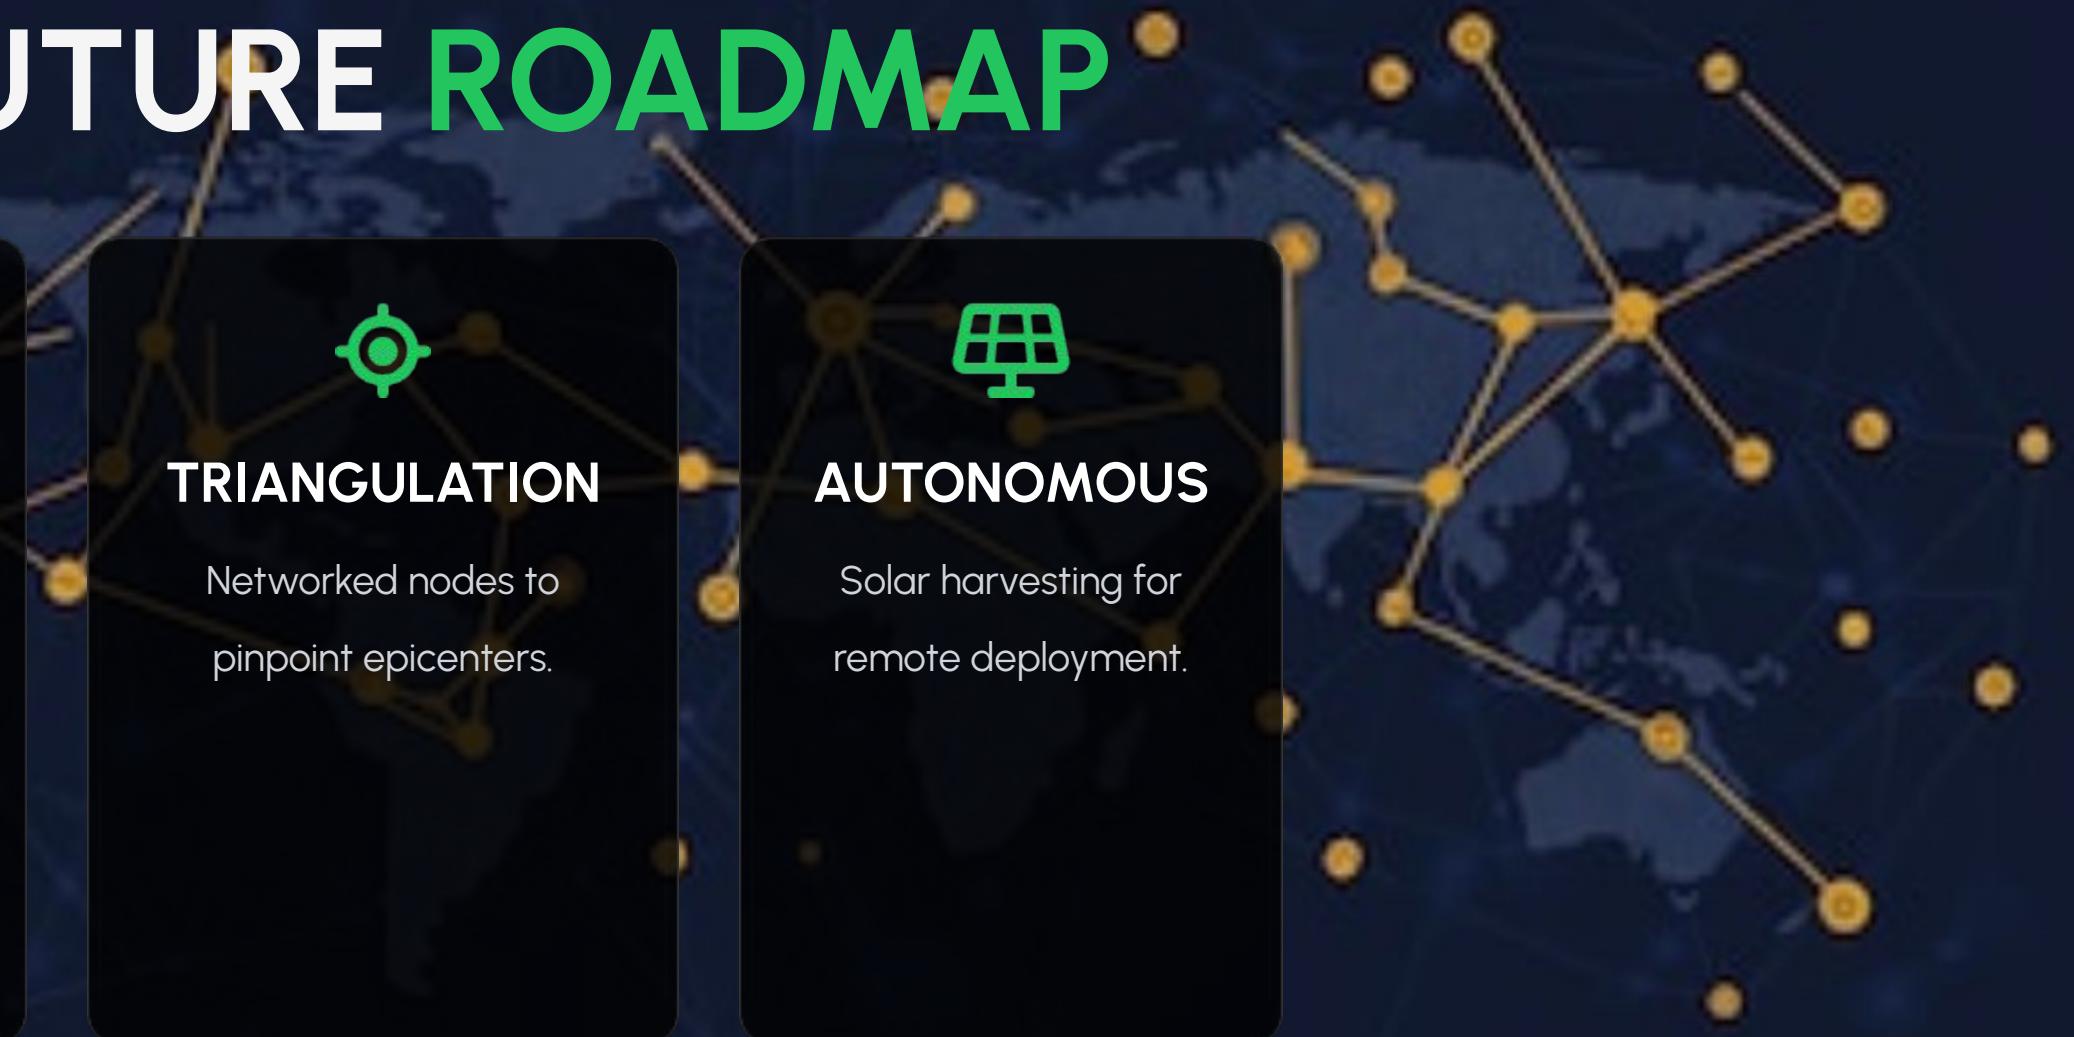

## TRIANGULATION

Networked nodes to pinpoint epicenters.

## AUTONOMOUS

Solar harvesting for remote deployment.
